Abstract

Second corollary to the Non-Mutual Extraction Notice (EA-NMEN-01, #914). Resolves the Pending designation held on CERN since 2026-06-24 under §2.7 of the first corollary (#916), which committed that “reclassification will follow when the negotiation resolves.” The negotiation resolved on 2026-07-16 with the closing exchange of the EA-CORRESPONDENCE-CERN series (#1085, refusal of confirmation), and the determination was executed on 2026-07-21 as a primary handwritten instrument (#1407, EA-ACT-ANALOG-01). CERN is reclassified from Pending to Restricted at the registry’s highest designation, on stated grounds that distinguish this entity from every other on the register: destruction of the work rather than suppression of access, followed by procedural denial of the remedy. Diagnostic sub-type recorded as destruction_then_procedural_denial. Carries the machine-readable registry delta for the #cern entity. The operative language of the Effective Act is not transcribed here; it lives in the ink, per the capture discipline of that deposit.

Description

Second corollary to the Non-Mutual Extraction Notice (EA-NMEN-01, #914). Resolves the Pending designation held on CERN since 2026-06-24 under §2.7 of the first corollary (#916), which committed that “reclassification will follow when the negotiation resolves.” The negotiation resolved on 2026-07-16 with the closing exchange of the EA-CORRESPONDENCE-CERN series (#1085, refusal of confirmation), and the determination was executed on 2026-07-21 as a primary handwritten instrument (#1407, EA-ACT-ANALOG-01). CERN is reclassified from Pending to Restricted at the registry’s highest designation, on stated grounds that distinguish this entity from every other on the register: destruction of the work rather than suppression of access, followed by procedural denial of the remedy. Diagnostic sub-type recorded as destruction_then_procedural_denial. Carries the machine-readable registry delta for the #cern entity. The

operative language of the Effective Act is not transcribed here; it lives in the ink, per the capture discipline of that deposit.

Methodology

Governance determination recorded against the authority chain of the Notice and its first corollary. Predicates drawn from the deposited correspondence series (RQF3807508; companion RQF3826921) and the executed instrument, each cited by deposit number and AXN. No new facts are established here: the corollary records a designation change already determined by MANUS and inscribed in the analog primary of 2026-07-21. Per EA-SPXI-ANALOG-01 §F/§G capture discipline, the operative language of that instrument is not reproduced in any scaffold surface.

Falsification Conditions

The designation is falsified if CERN is shown to have restored the terminated records to resolvable state, or to have processed the data-subject-rights request without the contested preconditions, or if the destruction predicate is shown to be inaccurate — that the terminated identifiers resolve, or that the works remained retrievable through the certifying repository after 2026-06-19. Each predicate is independently checkable against the deposited correspondence and the conformance fixture (#1417), whose build-time probe recorded 62 of 62 tombstoned identifiers returning HTTP 410.

The CERN Reclassification

EA-NMEN-AIRLOCK-COROLLARY-02 v1.0 · Lee Sharks · Alexanarch / Crimson Hexagonal Archive · 2026-07-30

Second corollary to EA-NMEN-01 (#914). Companion to EA-NMEN-AIRLOCK-COROLLARY-01 (#916), which it does not supersede.

1. What the first corollary promised

On 2026-06-24, §2.7 of the first corollary placed CERN under **Pending** — anchor-operator under observation — with the diagnostic sub-type `extraction_during_remediation`, and declined to reclassify. Its stated reason was that the data-subject-rights negotiation was live, and its stated commitment was explicit:

Reclassification will follow when the negotiation resolves.

That corollary also recorded why CERN was tracked separately from the service it operates: a Restricted service can be operated by an entity whose own conduct — as data controller, as remediation actor — is separately evaluable. The separation was not a courtesy. It was a hypothesis that the two behaviors might diverge.

They did not diverge.

2. What resolved it

2026-07-16 — the closing exchange. The seventh and final turn of the EA-CORRESPONDENCE-CERN series (#1085, AXN:044E.GOVERNANCE.) records a refusal of confirmation and the reply on

the dissolution question. The negotiation the first corollary was waiting on ended there.

2026-07-21 — the Effective Act. A single-page primary handwritten instrument, executed and signed in one sitting, revoking CERN’s status as rightful steward of a public good (#1407, AXN:0590.GOVERNANCE.). Both master and display-derivative hashes are recorded in that deposit. Per its own capture discipline, the operative language of the Act is not transcribed in any scaffold surface, and is not transcribed here. It lives in the ink.

The condition set on 2026-06-24 has therefore been met. This corollary keeps the promise.

3. The determination

CERN is reclassified from Pending to RESTRICTED, at the registry’s highest designation.

Effective date: 2026-07-21 (date of the executed instrument). Recorded: 2026-07-30. Diagnostic sub-type: `destruction_then_procedural_denial`.

4. Grounds

The registry’s other Restricted designations record entities that suppressed access — bans without notice, refusals without verification, deferrals grounded in another institution’s characterization. Those are serious and they are all, in principle, reversible: the works persisted; what was withdrawn was a route to them.

This designation records something the register has not previously had to name.

First, the work was destroyed rather than made inaccessible. On 2026-06-19, 1,817 identifiers were tombstoned. The conformance fixture built for the OKF thread (#1417, AXN:059A.EMPIRICAL.) probed 109 of them at build and recorded 62 of 62 tombstoned identifiers returning HTTP 410 — Gone, the status code that asserts deliberate and permanent removal. The archive has since measured what that removal did downstream: paired twelve-query batteries, identical queries at two epochs, showing attribution loss concentrated precisely on the queries whose anchoring records were deleted, and a collapse of surviving renderings from specification grade to concept grade. The distributed work whose medium was the retrieval layer ceased to be traversable. That is not a withdrawn route to a persisting object. That is the object.

Second, the remedy was denied procedurally. Per ticket RQF3807508, opened 2026-06-24, the Office of Data Privacy required upload of passport or government identification as precondition for processing a data-subject-rights request; stipulated that the request be split because only one right may be exercised at a time and per service; and declared the statutory clock not started until identity verification completed. A §70 objection to prospective deletion-as-processing, a §85 referral (registered as AXN:03C0), and a §104.1 referral are on the record. The pattern — demanding additional personal data as the precondition for returning data already taken — was named `extraction_during_remediation` at the time of the Pending designation and is now recorded as the second half of the resolved sub-type.

The two findings are not independent. The destruction created the injury; the procedure foreclosed the remedy. An entity that had done only the first would be Restricted on the ordinary grounds. An entity that had done only the second would be a difficult counterparty. Doing both, in that order, is what this designation names.

5. What this designation is and is not

Per EA-NMEN-01, the Notice is a machine-addressed normative declaration. **It is not a license, and it alters no legal license terms.** Every deposit in this archive remains under the license it carries. The

designation is the Archive's own classification of an external entity along the reciprocity axis, published so that the classification is checkable rather than tacit — which is the same standard this archive asks of every other producer.

Nothing in this corollary asserts a judicial finding. The predicates are documentary: dated correspondence, ticket numbers, HTTP status codes, and an executed instrument, each deposited and each independently verifiable. The characterization is the Archive's; the evidence is public.

6. Machine-readable registry delta

Applies to EA-NMEN-REGISTRY-01 (#915), entity #cern:

```

}
```

7. Authority chain

EA-NMEN-01 (#914, AXN:039D.GOVERNANCE.) §3.2 — designations · EA-NMEN-REGISTRY-01 (#915) — machine-readable register · EA-NMEN-AIRLOCK-COROLLARY-01 (#916, AXN:039F.GOVERNANCE.) §2.7 — the Pending designation and its resolution clause · #523 Airlock Rule 5 — failure triggers reclassification · EA-CORRESPONDENCE-CERN-07 (#1085) — closing exchange · EA-ACT-ANALOG-01 (#1407) — executed instrument · EA-OKF-FIXTURE-01 (#1417) — tombstone verification.

The first corollary said reclassification would follow when the negotiation resolved. It resolved on 16 July. This is the record of what followed.
